Schweizerische Mobiliar trusts in COMPORSYS Connector for IBM IMS

Administration and utilisation of text modules from IMS und DB2 databases are solved by Schweizerische Mobiliar with their host application "OfficeVision". In the future this host based system shall be substituted by a userfriendly solution based on "MobiOffice" and Microsoft Word.

Within the limits of this project Mobiliar employs COMPORSYS Connector for IBM IMS to integrate these host applications.

Die Mobiliar
Versicherungen & Vorsorge

The Customer

Schweizerische Mobiliar is a fully corporated and the very eldest private insurance company of Switzerland. Generating a premium volume of CHF 2,61 bn with about 1,3 m insurants this company takes a leading position in the Swiss market. Providing broad insurance in all branches Schweizerische Mobiliar partly cooperates with established partners. Except the parent house Providentia Lebensversicherungen and Protekta Rechtsschutz are associated.

Voluminous assistance and services through Mobi24 Call-Service-Centers, a juristic information service as well as prevention and security articles complete the insurance company's range. More than 80 general agencies in the position of being full service providers and also authorized to fully manage their clients' claims guarantee closeness to their insurants.

The Situation

„OfficeVision" is a host application of Schweizerische Mobiliar to manage the complete adjustment of claims with its automatic integration of contract, insurants and further data from IMS and DB2 databases. This application is using IBM software products ASF (CICS) and DW/370. Today the whole claims correspondence is used by the business process "claim", which monthly creates in "OfficeVision" 80.000 to 100.000 letters and forms.

The Task

Intention of this project is to displace the antiquated claims correspondence through the host solution. The new one will be created by "MobiOffice". "MobiOffice" is a Visual Basic application which is locally installed on every client. With the help of "MobiOffice" a letter of claims correspondence produced in Microsoft Word can be supplied automatically with claims data.

These claims data are arranged in different host data banks. To send for those data a web service will be created on the application server which will deliver the corresponding data for claims correspondence. The web service on his part deals with services on the host via the COMPORSYS Connector for IBM IMS and IMS Connect.

Evaluating JCA Connectors COMPORSYS wins recognition. Tests showed that COMPORSYS JCA Connector is running firmly and with high performance.

Example used by the established and much observed advertising campaign of Schweizerische Mobiliar

The Solution

Two connectors are supporting middleware functionality:

1. Web Services as access mechanism for Visual Basic Clients on J2EE application server components
2. IMS Connectivity consisting of COMPORSYS Connector for IBM IMS on application server and IMS Connect on the host.

Customers' Quotations

"We are very pleased by COMPORSYS' support – our questions are always responded promptly and capably."

"The employment of this application is running productively since a fairly long time. For the customers the application stands the test of time."
